

Amendments to the Claims: This listing of claims will replace all prior versions, and listings, of claims in the application

Listing of Claims:

1. (Currently amended) A collection device for use with a testing system, said device comprising:

a central chamber defining an open volume;

a trough defining an open volume, smaller than said open volume of said central chamber, said trough being positioned adjacent said central chamber, and said trough comprising a surface that includes at least one aperture positioned to allow excess sample stored in said trough to flow into said central chamber when said collection device is placed in an upright position after pouring;

an interior pour spout positioned for flow of a sample from said central chamber into said trough; and

an exterior pour spout positioned for flow of a sample from said trough and out from said device;

wherein said central chamber is adapted to hold a sample, said trough is adapted to receive a controlled volume of the sample as the sample is poured from said device through said interior pour spout and said exterior pour spout, and said trough is configured to receive a portion of a test kit for submersion in said controlled volume of the sample.

2. (Cancelled).

3. (Original) A collection device according to claim 1, further including an engagement mechanism configured to hold a test kit in said trough.

4. (Original) A collection device according to claim 3, wherein said engagement mechanism includes locating fingers configured to engage the test kit.

5. (Original) A collection device according to claim 4, wherein said trough holds a predetermined volume sample when the test kit is inserted into said trough.

6. (Original) A collection device according to claim 5, wherein said predetermined volume is in a range of 1000 microliters to 2000 microliters.
7. (Original) A collection device according to claim 1, wherein said central chamber has an asymmetrical cross-sectional shape.
8. (Original) A collection device according to claim 7, wherein said central chamber defines a "D" shaped cross-section.
9. (Original) A collection device according to claim 1, further comprising a cup defining said central chamber and a lid configured to at least partially cover said central chamber.
10. (Original) A collection device according to claim 9, wherein said trough is formed in said cup.
11. (Original) A collection device according to claim 10, said trough being formed on an exterior surface of a side surface of said central chamber.
12. (Currently amended) ~~A collection device according to claim 9, wherein said trough is formed in said lid~~ for use with a testing system, said device comprising:
 - a cup defining a central chamber, said chamber defining an open volume;
 - a lid configured to at least partially cover said central chamber;
 - a trough formed in said lid, said trough defining an open volume smaller than said open volume of said central chamber, said trough being positioned adjacent said central chamber;
 - an interior pour spout positioned for flow of a sample from said central chamber into said trough; and
 - an exterior pour spout positioned for flow of a sample from said trough and out from said device,
 - wherein said central chamber is adapted to hold a sample, said trough is adapted to receive a controlled volume of the sample as the sample is poured from said device through said interior pour spout and said exterior pour spout, and said trough is configured to receive a portion of a test kit for submersion in said controlled volume of the sample.

13. (Original) A collection device according to claim 12, said interior pour spout comprising an aperture defined in said lid to permit the flow of sample from said central chamber of said cup into said trough of said lid.

14. (Original) A collection device according to claim 13, wherein said aperture defined in said lid comprises a slot.

15. (Original) A collection device according to claim 12, wherein said trough comprises a reservoir configured to hold a predetermined volume of sample when the test kit is inserted into said trough.

16. (Original) A collection device according to claim 15, wherein said reservoir is configured to receive a portion of the test kit for submersion in said predetermined volume of sample.

17. (Original) A collection device according to claim 12, wherein said trough comprises a base surface, said base surface defining a reservoir configured to hold a predetermined volume of sample when the test kit is inserted into said trough.

18. (Original) A collection device according to claim 17, said base surface of said trough further defining at least one aperture positioned to allow excess sample stored in said trough to flow into said central chamber when said collection device is placed in an upright position after pouring.

19. (Original) A collection device according to claim 12, wherein said trough comprises a side surface defining a channel positioned to guide a test kit as it is inserted into said trough.

20. (Currently amended) A method for testing a sample using a test kit, said method comprising the steps:

(a) providing a collection device having a central chamber, a lid, a cup, a trough formed in the lid positioned adjacent the central chamber and configured to receive a portion of the test kit, an interior pour spout positioned between the central chamber and the trough, and an exterior pour spout;

- (b) attaching the lid to the cup;
- (c) ~~(b)~~ introducing a sample into the central chamber;
- (d) ~~(e)~~ pouring sample from the collection device through the interior and exterior pour spouts, thereby introducing a controlled volume of the sample into the trough; and
- (e) ~~(d)~~ inserting the test kit into the trough in the lid, thereby submerging a portion of the test kit in the controlled volume of the sample.

21. (Cancelled).

22. (New) A collection device for use with a testing system, said device comprising:

- a central chamber defining an open volume;
 - a trough defining a test kit docking area and having an open volume smaller than said open volume of said central chamber;
 - an interior pour spout connecting said central chamber and said test kit docking area in fluid communication; and
 - an exterior pour spout connecting said test kit docking area in fluid communication with the exterior of said device;
- wherein said central chamber is adapted to hold a sample, said trough is adapted to receive a controlled volume of the sample into the test kit docking area as the sample is poured from said device through said interior pour spout and said exterior pour spout, and said trough is configured to receive a portion of a test kit for submersion in said controlled volume of the sample in the test kit docking area.
